Build
Please sign in and open the GPU control room and the intern view. Tell me anything that looks off, such as hard-to-read text or a leftover dark element.

Link is set up for publishing, and the Publish button is ready for you to click. The build runs npm run build and the app starts with npm run start. Production serves the built site and the backend together on one address, and I set the hosting type to autoscale. I haven't published it myself.
The production site will use the Clerk keys and secrets your project already has. Your Clerk setup is on development keys, which have usage limits, so switch to production keys in Clerk before you share the site widely.
